

Our Services

Quality...Is In All We Do.

Quality Production Management (QPM) provides its clients with premier operations management services within the continental United States. Founded in 2007, QPM is comprised of contract operations services incorporating offshore production and plant/pipeline operations, managed properties, logistics coordination and platform maintenance.

QPM's commitment to quality is built on the knowledge and expertise of its specialized workforce, focused on providing the United States with high quality production operators with a focus on safety, efficiency and productivity who deliver more than just by-the-book tasks; they perform evaluations, process improvements and detailed planning on every project. A supplemental labor division provides clients with premier start-up and operations management services along with production operators, mechanics, electricians, field foremen and superintendents.

Over the years, QPM's excellence has flourished and our commitment to knowledge and expertise has followed suit. Our competitive workforce has merited us an exceptional reputation along the Gulf Coast region.

Quality Production & Management

While detailed planning on every project is vital to QPM, safety is also a leading and top priority. With 35+ years' experience in offshore production and more, Quality Production Management service offerings are unlike any other within the continental United States.

Lafayette-based Quality Production Management has serviced the oil, gas and pipeline industry for longer than a decade. Whether offshore production, plant/pipeline operations, managed properties, logistics coordination or platform maintenance, our operations management services are unmatched. QPM is that level of expertise you are seeking for your next performance evaluation, process improvement or detail-oriented approach on that operations project. Quality Production Management operations management services and personnel hold true to the motivation behind our business.

The Quality Production Management training lab provides a setting for developing and verifying the technical skills needed to efficiently and safely perform the duties required for a production operator, measurement technician and I&E technician. Skills in process systems, instrumentation, electrical, mechanical, safety and computers, along with soft skills, such as communication and teamwork, are all part of the Quality Production Management's training lab curriculum and our competency assurance system.
